Poverty has become a source of intrinsic motivation for me to study and undertake research. Through extensive research in computer science, I am able to combat the real problem in my life that is poverty. I intend to pursue a master's degree in computer science since I have completed my undergraduate degree from Iqra University, Karachi. My GPA in undergraduate featured among the best five in my class, but I had an unmatched exemplary performance in mathematics. I take pride in being the only undergraduate student from Iqra University, Karachi to participate in a modeling contest for mathematics students, and I emerged second overall. Immediately after graduation, I landed a job at a leading fuel company where I have been working as a network specialist and manager. This job has provided me an opportunity to get on-the-job training on masters' level education in computer science.

My current undergraduate degree in computer science has not put an end to my pursuit of academic excellence. My role as a network specialist and manager has fostered my quest to upgrade my professional knowledge because of rapid development of information technology across the world. As such, I have identified a master's level education in computer science as an integral aspect of academic and career development. The undergraduate degree course laid a solid foundation for undertaking a master's degree because of extensive research in computer networks, multimedia network, Logic, advanced computer systems and network infrastructure. As such, this foundation is a strong basis unto which I am applying for a masters' program in computer science at your university.

During my pursuit of an undergraduate degree program, I have increased my efforts in improving research and development capabilities. In my workplace, I have partnered with other colleagues to complete a WLAN project, where I was involved in the collection of technical materials and an in-depth analysis of this technology. My role during this study was to design a

plan that was satisfactory in addressing clients' demands. Particularly, I identified security of WLAN as a major problem, and I developed a small-size business pattern to solve this problem. The security plan received a lot of positive criticism from experts, and it was classified as technological advancement, reliable and a model of research and development.

I wish to apply for a masters' program in computer science from your outstanding university. The design of masters' programs in your university has interested me because it will satisfy my desire for development and enable me an opportunity to undertake research in my major area of concern. Interrogating my past experience in research has proved to me that as a giant in modern computer science and technology, your institution is the best that will offer me advance training that is vital for my career development and educational ambitions. I am certain that your institution will expose me to instructions from reputable researchers and experts in computer science whose ideas and academic contribution will be handy in broadening my scope and academic prowess. Further, your state of the art library will be a major resource for my study for the masters' program.

In conclusion, I consider myself qualified and up to the tasks as required of a masters' student in your University. Therefore, it is my utmost belief that your institution is a starting point my treasured joy of poverty that will give me an edge in achieving a rewarding academic journey.
